

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

AVARAGE AND PROBABILITY.

57. Proposed by G. B. M. ZERR, A. M., Ph. D., President and Professor of Mathematics, Russell College, Lebanon, Va.

A chord is drawn through two points taken at random in the surface of a circle. If a second chord be drawn through two other points taken at random in the surface, find the chance that the quadrilateral formed by joining the extremities of the two chords will contain the center of the circle.

58. Proposed by HENRY HEATON, M. Sc., Atlantic, Iowa.

From a point on the surface of a circle two lines are drawn to the circumference. Required the average area that may be cut from the circle in this way if the lines are supposed to be drawn at equal angular intervals.

Query I. How does this differ from problem 32?

Query II. Is *sector* the proper word to use for the surface thus cut off?

Query III. It is absolutely correct to use the word *random* in average problems?

NOTES.

THE INTERNATIONAL MATHEMATICAL CONGRESS.

The meeting at Zurich, August 9th-11th, of the International Congress of Mathematicians was in every way a success. More than two hundred members took part. America sent seven representatives, including, however, three Cambridge graduates, now transplanted to Pennsylvania, Professors Harkness, Morley and Charlotte Scott. The greatest mathematician in the world, Sophus Lie, was not expected; and the greatest French mathematician, Poincaré, though down for a speech, did not come; but the actual program was particularly rich and interesting.

It is very noteworthy that the Congress was divided into five sections: (1) Arithmetic and Algebra; (2) Analysis, and Theory of Functions; (3) Geometry; (4) Mechanics and Mathematical Physics; (5) History and Bibliography.

The program of the first section contained the only title in English: "On Pasigraphy, its present state and the pasigraphic movement in Italy," by Ernst Schroeder, of Karlsruhe, author of "Algebra der Logik."

The second section contained a title from Z. de Galdeano, whose heroic efforts gave Spain a Journal of Mathematics, now unfortunately dead in the decadence of that beautiful, priest-ridden land.

The program of the third section, the only one consecrated wholly to a single title, Geometry, contained two titles on the non-Euclidean geometry.

Burali: Les postulats pour la géométrie d'Euclide et de Lobatschewsky.

Andrade: La statique non euclidienne et diverses formes mécaniques du postulat-um d'Euclide.

In Section IV. Stodola treated an important subject, "Die Beziehungen der Technik zur Mathematik."

In the fifth section Eneström gave an important discussion of bibliography, a point where the Congress can and will render aid of fundamental importance.

In the first general assembly Rudio spoke on the aim and organization of international mathematical congresses.

It was determined that the next Congress should take place at Paris in 1900, under the auspices of the Société Mathématique de France.

As aims were specified : (1) to promote personal relations between mathematicians of different lands ; (2) to give, in reports or conferences, an aperçu of the actual state of the divers branches of mathematics, and to treat questions of recognized importance ; (3) to deliberate on the problems and organization of future congresses ; (4) to treat questions of bibliography, of terminology, etc., on subjects where an *entente internationale* appears necessary.

Rudio mentioned the yearly issue of an address-book of all the mathematicians of the world with indication of their specialties ; also of a biographic dictionary of living mathematicians with portraits ; also of a literary journal for mathematics.

At the second general assembly Peano gave a conference : “Logica mathematica” ; and Felix Klein a conference on teaching higher mathematics.

Three important resolutions were introduced by Vasiliev, of Kazan ; Laisant, of Paris, and G. Cantor, of Halle, constituting : (1) a commission for preparation of general reports ; (2) a standing bibliographic and terminology commission ; (3) a commission to give the congress a permanent character by archives, libraries, stations for correspondence, editing or publishing noteworthy works, etc.

Surely this Congress has proven that it came only in the fullness of time, and that the world moves !

GEORGE BRUCE HALSTED.

Austin, Texas.

EDITORIALS.

Dr. O. E. Lovett has been called to Princeton University as Assistant Professor of Mathematics.

Dr. George Lilley, LL. D., has been elected to the Chair of Mathematics in the State University of Oregon.

A portrait of a group of five of our contributors will appear soon. We were unable to complete the arrangements for this number.

Dr. L. E. Dickson, who spent last year at the Universities of Göttingen and Paris, has been elected Assistant Professor of Mathematics in the University of California.
